**Question Paper Code: 35401** 

## B.E. / B.Tech. DEGREE EXAMINATION, NOV 2019

Fifth Semester

**Electronics and Communication Engineering** 

## 01UEC501 - DIGITAL COMMUNICATION

(Regulation 2013)

Duration: Three hours Maximum: 100 Marks

## **Answer ALL Questions**

PART A - 
$$(10 \times 2 = 20 \text{ Marks})$$

- 1. Define channel. What are the types of channel.
- 2. Bring out any two merits and demerits of digital communication.
- 3. State sampling theorem.
- 4. How can BER be improved?
- 5. What is inter symbol interference?
- 6. Compute the matched filter output over (0, T) to the pulse waveform  $S(t) = e^{-t}$  for  $0 \le t \le T$
- 7. List any two remedy to reduce ISI.
- 8. What are coherent and non-coherent receivers?
- 9. Mention any two properties of maximum-length sequences.
- 10. What is anti jam?

## PART - B (5 x 16 = 80 Marks)

| 11. | (a) | Explain the geometric representation of signals.                                                                              | (16)          |
|-----|-----|-------------------------------------------------------------------------------------------------------------------------------|---------------|
|     |     | Or                                                                                                                            |               |
|     | (b) | State the need for modeling of channels. Elaborate on mathematical models communication system.                               | of a<br>(16)  |
| 12. | (a) | With neat block diagram, explain pulse code modulation and demodulation.                                                      | (16)          |
|     |     | Or                                                                                                                            |               |
|     | (b) | Explain in detail about non-uniform quantization technique.                                                                   | (16)          |
| 13. | (a) | Derive and Explain the Nyquist first criterion to minimize ISI.                                                               | (16)          |
|     |     | Or                                                                                                                            |               |
|     | (b) | Describe the principle of signal reception using a correlator type receiver.                                                  | (16)          |
| 14. | (a) | Describe with diagrams the generation and detection of coherent binary FSK. Expense the probability of error for this scheme. | plain<br>(16) |
|     |     | Or                                                                                                                            |               |
|     | (b) | Explain the working of a QPSK schemes with its transmitter and receiver bediagrams.                                           | olock<br>(16) |
| 15. | (a) | (i) List and prove the properties of PN sequence.                                                                             | (8)           |
|     |     | (ii) Write short notes on frequency hopping.                                                                                  | (8)           |
|     |     | Or                                                                                                                            |               |
|     | (b) | Explain the operation of direct-sequence spread spectrum and its processing                                                   | gain.<br>(16) |
|     |     |                                                                                                                               |               |
|     |     |                                                                                                                               |               |
